How to read this:

If a name is below another, without another third in the middle, it means the second (the one below) is a member of the first one. The one above is the father class, the one below is the member class.

If an asterisk (*) is between two names it means there might be n instances of the member class associated to the father class.

If a triangle (▲) is below a name, it means the rest of the names are from classes that are implemented / extended by the class of the name above it.
